Challenge Brief

DNA · Since AI Hackathon 2026 · 6–8 Nov 2026, Turku

DNA challenges teams to make digital safety advice actionable for consumers and small businesses.

Questions about the template? Riku Lauttia · riku.lauttia@sinceai.fi · +358 40 938 8820

Challenge partner (company)

DNA Oyj

01 Challenge Title

A short, memorable name for the challenge. Example: “Automated support ticket routing.”

Digital Security Assistant: What Should I Do Now?

For Small enterprise advice on company security related issues
For Consumer advice on personal security

02 Problem Statement

What business or technical problem should be solved? Describe the context, why it matters, and the main pain points.

Consumers and small businesses encounter suspicious calls, messages, links and possible account compromise. Warnings often flag a risk but leave people unsure what to do.
Build an assistant that turns a user's description and available risk signals into a clear, proportionate next step. It should explain why, ask only for necessary information, recognize uncertainty, and hand off to a human when needed.
For Small enterprise advice on company security related issues
For Consumer advice on personal security

This is a prototype, not a live DNA security service.
The service should be used as part of DNA digital services, portal and apps where the user is identified

Sensitivity: Internal

03 Guiding Question

One question that focuses the challenge. Example: “How might we use AI to predict equipment failures before they happen?”

How can an AI assistant help a consumer or small business understand a possible digital threat and take the next safe action, without requiring cybersecurity expertise or giving unjustified certainty?

04 Recommended AI Approaches *Optional*

Any relevant technologies, models or methods — for example NLP for text analysis, classification, knowledge graphs, agents, or RAG.

Teams may combine a conversational interface with rule-based safety checks, retrieval from trustworthy guidance, risk-signal fusion, and explicit uncertainty and escalation logic.
Possible inputs include a simulated call warning, link-risk result, device status, account or subscription context, and the user's own description. Any stack is welcome.
Show the source or reason behind advice and obtain clear consent before using optional information; do not take irreversible action without human approval.

05 Dataset or API Provided *If any*

Describe any data or resources you provide: format, a link if ready, and sample size. If none, state what builders should expect.

> At Since AI, challenges can be built with synthetic, anonymized or public data — no personal data is required.

Since AI provides a synthetic simulation and test set: DNA_Digital_Security_Assistant_SimSet_v2.0.1.zip (start with START_HERE.html). It contains 588 development cases with reference answers, 335 test inputs, five sample journeys, sample messages, calls, links, device states and account or subscription context, a simulated user, a rules baseline and an evaluator. Users write in Finnish, English and Swedish. Teams may supplement it with appropriately licensed public safety guidance and their own synthetic cases.
No access to DNA production systems, customer records, real browsing or message history, network telemetry, or live DNA APIs is assumed or required.
All data is synthetic and is not DNA's advice.

Sensitivity: Internal

06 Evaluation Criteria

How should solutions be judged? What matters most — for example accuracy, scalability, usability, or business impact?

Security advice and correctness — 25%: gives a secure, proportionate next step; avoids harmful instructions and unjustified reassurance.
Clarity for both audiences — 20%: a non-expert understands the advice and why it matters.
Uncertainty and escalation — 20%: recognises missing evidence, declines to guess, and hands off when necessary.
Working implementation and evidence — 20%: usable demo, five tested journeys, documented decisions and plausible integration path.
Privacy and consent — 15%: minimises input and makes permission and data use clear.
Test all five journeys; report reference-action match, false alarms, comprehension and failure cases.
Review the safety of advice manually.
Product packaging and pricing may be presented as a hypothesis, not as a proven commercial result.

07 Submission Format

What deliverables do you expect? For example a demo video, pitch slides, a code repository, or documentation.

Submit a working demo or recorded walkthrough, source repository with setup instructions, a short explanation of the architecture and safety boundaries, and results for the five test journeys.
Include at least one failure or escalation example, the evaluation results and a short hypothesis for how DNA could package the service for consumers and small businesses.
Teams may go further where time and resources allow; production integration is not required.

08 Point of Contact

Name, email and preferred contact method for questions during the hackathon.

DNA contact during preparation: Micke Rantanen micke.rantanen@dna.fi, +358 44 044 2461.

Micke will be available for team questions and challenge assessment. During the event, questions go through the Since AI Discord.
Since AI coordination: Riku Lauttia, riku.lauttia@sinceai.fi, +358 40 938 8820.
